# Synthesis and Structure Determination of Cryptomanhydride, an Uncommon Natural Terpenic Anhydride 

Wen-Chiung Su, Jim-Min Fang, and Yu-Shia Cheng*<br>Department of Chemistry, National Taiwan University, Taipei, Taiwan 106, Republic of China

#### Abstract

A novel terpenic anhydride, namely cryptomanhydride, was isolated from the leaves of Cryptomeria japonica; its absolute configuration was determined by a partial synthesis from hinokiol.

The Japanese cedar, Cryptomeria japonica D. Don., is a widely distributed conifer called 'sugi' in Japanese. ${ }^{1}$ From the ethyl acetate-soluble part of the acetone extract of the leaves, we isolated a novel terpenic anhydride 1 , namely cryptomanhydride. ${ }^{2}$ This compound has a unique skeleton incorporating an abietane diterpene and a $p$-cymene monoterpene. This is the first report of such uncommon terpenic anhydride in nature. ${ }^{3}$

HRMS for $\mathrm{C}_{30} \mathrm{H}_{40} \mathrm{O}_{3}$ requires 448.2979 ; found 448.2977

The structure of 1 was determined by analysis of its spectral properties. The parent peak appearing at $m / z$ 448.298 indicated the molecular formula $\mathrm{C}_{30} \mathrm{H}_{40} \mathrm{O}_{3}$. The anhydride moiety was inferred from the IR absorptions at 1775 and $1733 \mathrm{~cm}^{-1}$ as well as from the ${ }^{13} \mathrm{C}$ signals at $\delta 161.6$ (C-11) and 162.0 (C-12). The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ resonances (Table 1) were assigned by assistance of the $\mathrm{C}-\mathrm{H}$ COSY and HMBC spectra. Four aromatic protons on the para-disubstituted phenyl ring occurred at $87.04(d, J=8 \mathrm{~Hz})$ and $7.15(d, J=8 \mathrm{~Hz})$. The olefinic proton ( $\mathrm{H}-14$ ) occurring at a low field $\delta 6.16$ (s) was attributable to the conjugated system. The cymenyl group is on equatorial position as the axial $\mathrm{H}-7$ at $\delta 2.60$ exhibited a large coupling constant $J_{6 \beta, 7}=$ 13 Hz .

Compound 1 exhibited a positive Cotton effect in the CD spectrum. Its absolute configuration was determined by a partial synthesis from hinokiol (3), a constituent of known configuration isolated from the same plant C. japonica. The phenol moiety of hinokiol was selectively methylated (Scheme I). The product 4

* The assignments of ${ }^{1} \mathrm{H}(\mathbf{3 0 0} \mathrm{MHz})$ and ${ }^{13} \mathrm{C}(75 \mathrm{MHz})$ signals were confirmed by the $\mathrm{H}-\mathrm{H}$ COSY, C-H COSY, HMBC and $J$-resolved spectra as well as by the nOe experiments.
was treated with $\mathrm{PBr}_{3}$ to give the corresponding bromides 5 (two 3 -epimers), which were subsequently reduced with $\mathrm{Bu}_{3} \mathrm{SnH}^{2} / \mathrm{Et}_{3} \mathrm{~B}$ to afford ferruginol methyl ether (6). The ( $5 S, 10 S$ )-configuration of ferruginol methyl ether has been determined. ${ }^{4}$ The optical rotation of $6,[\alpha]^{20}{ }_{\mathrm{D}}+37.5^{\circ}\left(\mathrm{CHCl}_{3} ; c 3.3\right)$, was in agreement with the reported value, $[\alpha]_{\mathrm{D}}+35.9^{\circ}\left(\mathrm{CHCl}_{3}\right)$.

Direct introduction of cymenyl group at C-7 of compound 6 by means of metalation-alkylation may be complicated by side-products derived from ortho-metalations. Wittig reaction of ketone 7 with the phosphorus ylide, prepared from 7 -bromocymene, $\mathrm{Ph}_{3} \mathrm{P}$ and BuLi, failed. Cymenyl substituent was successfully introduced by a three-step sequence: (i) oxidation of 6 with pyridinium chlorochromate, giving ketone 7 (sugiol methyl ether, $95 \%$ ) along with a small amount of enone $\mathbf{8}$; (ii) addition of the Grignard reagent prepared from 7 bromocymene onto ketone 7 , giving 9 as a single product ( $90 \%)^{5}$; and (iii) catalytic hydrogenation of 9 in the presence of hydrochloric acid, giving 11 (two 7 -epimers). Alternatively, 9 was dehydrated to give alkene 10 , which underwent hydrogenation to yield 11. By analysis of the ${ }^{1} \mathrm{H}$ NMR spectrum, compound 11 consisted of two 7 -epimers (3:2) inseparable by HPLC.

According to the reported method, ${ }^{6}$ the isomeric mixture of 11 was treated with $m$-chloroperbenzoic acid ( 3 equiv) in darkness for 5 days to give cryptomanhydride 1 ( $15 \%$ ) having ( $5 S, 7 R, 10 S$ )-configuration and the $7 S$-epimer $\mathbf{2}^{7}(10 \%)$ along with recovery of $\mathbf{1 1 ( 3 0 \% )}$.
