

Previous studies have shown that amines and amino derivatives with active hydrogen are prone to have regioselective hydroamination to  $[M(PPh_3)_2(\eta^3-C_3H_3)]^+$  [ $M = Pd$  (**2**),  $Pt$  (**3**)], yielding azatrimethylenemethane (N-TMM) complexes and their derivatives [11]. However, heating the mixture of **2** and **1b** at 50 °C [was found to generate the pyrrole derivatives. Deliberate investigation shows that reactions of equimolar amounts of **2** and enamine at 25 °C undergo unprecedented hydroalkenylation. The regioselective C–C coupling takes place between the central carbon of the  $C_3H_3$  and the  $\delta$ -olefinic carbon of the enamine, and results in the enamine-allyl complexes in the formula of  $Pd(PPh_3)_2\{\eta^3-CH_2C[C(COR)CMe(NH^iPr)]-CH_2\}^+$  [ $R = Me$  (**4a**),  $OMe$  (**4b**)] with the yields over 75%. Complexes **4a** and **4b** were mainly characterized by NMR techniques as well as elemental analysis. Either heating the reaction solutions of complexes **4a** and **4b** to 50 °C, or treating them with base, the products of pyrrole derivatives **6a** and **6b** could be obtained, respectively (Scheme 1).

**Scheme 1**

The analogous reactions of  $[Pt(PPh_3)_2(\eta^3-C_3H_3)](BF_4)$  (**3**) with **1a** or **1b** produced  $\{Pt(PPh_3)_2(\eta^3-CH_2C[C(COR)=CMe(NH^iPr)]-CH_2)\}(BF_4)$  [ $R = Me$  (**4a'**),  $OMe$  (**4b'**)] also in very good yields. The enamine-allyl platinum complexes could be formed alternatively from the reactions of *trans*- $Pt(Br)(PPh_3)_2(\eta^3-CHCCH_2)$  and enamine at 25 °C [however, with longer reaction time. The single-crystal X-ray crystallography provides the authentic molecular structure for **4b'**. Figure 1 shows its ORTEP drawing. The length of C2–C4 is 1.46(2) Å, a typical  $C_{sp^2}-C_{sp^2}$  single bond. The dihedral angle between the C1–C2–C3 and C1–Pt–C2 planes is 68(1)°, and  $\angle C1-C2-C3$  is 113(1)°, which are consistent with the  $\eta^3$ -allyl characteristic and somewhat approach that of the  $\eta^3$ -trimethylenemethane species [7, 12]. It indicates that there is significant electronic delocalization in the planar N–C5–C4–C10–O1 moiety of enamine. The distance between N and O1 atoms is 2.52 Å that is suitable for hydrogen bonding in the vicinity. However, the generated amino hydrogen points out of the enamine plane with  $\angle O1-H-N = 116(7)^\circ$  [13].

Ring closure in **4a'** and **4b'** could be accomplished by heating or treating with base as well, except that cyclization in **4b'** first generates a dihydropyrrole derivative **5b**. Upon chromatographing on a silica gel column, **5b** would isomerize to the stable pyrrole product **6b**. Such a reaction is mechanistically comparable to the furan formation from an enolate-allyl complex [14].

### 3. Conclusion

The regioselective addition of enamine to the  $\eta^3$ -allenyl/propargyl complexes demonstrate a new type of “alkene-alkyne” coupling which affords new enamine-allyl complexes and leads to the formation of pyrrole derivatives.

## 4. Experimental Section

### 4.1. General

Commercially available reagents were purchased and used without purification unless necessary. Solvents were dried with use of standard procedures. All reactions and other manipulation were carried out under a nitrogen atmosphere, using standard Schlenk techniques. The IR spectra were recorded on a Bio-Rad FTS-40 spectrophotometer. The NMR spectra were run on either a Bruker AC-200 or ACE-300 spectrometer. For the <sup>31</sup>P NMR spectra, the spectrometer frequency at 81.015 or 121.49 MHz was employed, and the chemical shifts are given in ppm (δ) relative to 85% H<sub>3</sub>PO<sub>4</sub> in CDCl<sub>3</sub>. Values upfield of the standard are defined as negative. The corresponding frequencies for <sup>13</sup>C NMR spectra were at 75.47 MHz, respectively. Mass spectrometric analyses were collected on a JEOL SX-102A spectrometer. Elemental analyses were done on a Perkin Elmer 2400 CHN analyzer.

### 4.2. Synthesis and Characterization

**{Pd(PPh<sub>3</sub>)<sub>2</sub>(y<sup>3</sup>-CH<sub>2</sub>C[C(COMe)=CMe(NH<sup>i</sup>Pr)]CH<sub>2</sub>)}(BF<sub>4</sub>) (4a).** The reaction of **2** (300 mg, 0.39 mmol) and (MeOC)HC=CMe(NH<sup>i</sup>Pr) (**1a**) (55 -L, 0.039 mmol) was carried out in 20 mL predried CH<sub>2</sub>Cl<sub>2</sub> at -30 ¼[ After stirring for 90 min, the solution was concentrated to 2 mL. Adding 20 mL of dried Et<sub>2</sub>O gave yellow solid product. Recrystallization resulted in **4a** in 76% isolated yield (260 mg). <sup>31</sup>P NMR (CDCl<sub>3</sub>, 300 MHz) δ 23.8; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz) δ 1.21, 1.24 (3H, 3H, s, s, CH<sub>3</sub>), 2.00 (6H, d, J<sub>HH</sub> = 6.9 Hz, CH(CH<sub>3</sub>)<sub>2</sub>), 3.50 (2H, m, br, H<sub>anti</sub>), 3.69 (1H, m, CH(CH<sub>3</sub>)<sub>2</sub>), 4.12 (2H, br, H<sub>syn</sub>), 7.02-7.73 (30H, m, phenyl H), 12.6 (1H, d, J<sub>HH</sub> = 2.2

**3-carboxymethyl-2-methyl-4-methylene-N-isopropylidihydropyrrole (5b)**. <sup>1</sup>H NMR (C<sub>6</sub>D<sub>6</sub>, 200 MHz)  $\delta$  1.13 (6H, d,  $J_{\text{HH}} = 6.5$  Hz, CH<sub>3</sub>), 2.31 (3H, s, CH<sub>3</sub>), 3.61 (3H, s, OCH<sub>3</sub>), 4.01 (1H, m,  $J_{\text{HH}} = 6.5$  Hz, CH), 4.18 (2H, t,

$J_{\text{HH}} = 3.4$  Hz, CH<sub>2</sub>), 4.52, 5.10 (1H, 1H, dt,  $J_{\text{HH}} = 1.5, 3.4$  Hz, =CH<sub>2</sub>).

**3-acetyl-2,4-dimethyl-N-isopropylidihydropyrrole (6a)**. A solution that contained **4a** (30 mg) in 2 mL of chloroform was heated at 50 °C for 24 h. The solution was then chromatographed on alumina and eluted with Et<sub>2</sub>O. Compound **6a** was obtained in 75% yield. <sup>1</sup>H NMR (CDCl<sub>3</sub>, 200 MHz)  $\delta$  1.34 (6H, d,  $J_{\text{HH}} = 6.6$  Hz, CH(CH<sub>3</sub>)<sub>2</sub>), 2.38, 2.47 (3H, s, s, CH<sub>3</sub>), 4.28 (1H, m,  $J_{\text{HH}} = 6.6$  Hz, CH(CH<sub>3</sub>)<sub>2</sub>), 6.38 (1H, s, =CH).

**3-carboxymethyl-2,4-dimethyl-N-isopropylpyrrole (6b)**. <sup>1</sup>H NMR (CDCl<sub>3</sub>, 200 MHz)  $\delta$  1.34 (6H, d,  $J_{\text{HH}} = 6.6$  Hz, CH<sub>3</sub>), 2.19 (3H, s, CH<sub>3</sub>), 2.48 (3H, s, CH<sub>3</sub>), 3.76 (3H, s, OCH<sub>3</sub>), 4.27 (1H, m,  $J_{\text{HH}} = 6.6$  Hz, CH<sub>2</sub>), 6.38 (1H, s, =CH); <sup>13</sup>C NMR (CDCl<sub>3</sub>, 300 Hz) 11.1, 12.8, 23.2, 46.6, 50.3, 114.0, 120.4, 128.4, 132.0, 166.9; HRMS: calcd for C<sub>11</sub>H<sub>17</sub>NO<sub>2</sub> (M<sup>+</sup>) 194.1181, found 194.1180.

#### 4.3. X-ray crystallographic Analysis.

basis of an experimental  $\psi$  rotation curve. The refinement procedure was by a full-matrix least-squares method including all the non-hydrogenic atoms anisotropically. Hydrogen atoms were fixed at the ideal geometry and the C-H distance of 1.0 Å; their isotropic thermal parameters were fixed to the values of the attached carbon atoms at the convergence of the isotropic refinement. Atomic scattering factors were taken from ref 15. Computing programs are from the NRCC SDP VAX package [16]. Crystallographic data, selected bond parameters of **4b'** are collected in Tables 2 and 3. UK on request, quoting the deposition number 135924.

**Acknowledgments** We thank the National Science Council, Taiwan, ROC for the financial support.
