#### Abstract

The reactions of enamines (ROC) HC= $\mathrm{CMe}\left(\mathrm{NH}^{\mathrm{i} P r}\right)$ with $\eta^{3}$-allenyl/propargyl complexes $\left[\mathrm{M}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{3}-\mathrm{C}_{3} \mathrm{H}_{3}\right)\right]^{+}(\mathrm{M}=\mathrm{Pd}, \mathrm{Pt})$ result in the formation of pyrrole derivatives. Such reactions involve the intermediates of central-carbon-substituted $\eta^{3}$-allyl complexes $\left\{\mathrm{M}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{3}-\mathrm{CH}_{2} \mathrm{C}\left[\mathrm{C}(\mathrm{COR})=\mathrm{CMe}\left(\mathrm{NH}^{\mathrm{i} P r}\right)\right] \mathrm{CH}_{2}\right)\right\}^{+}$which are formed by hydroalkenylation to the $\mathrm{C}_{3} \mathrm{H}_{3}$ moiety. ©2000 Elsevier Science Ltd All rights reserved.

Keywords: Enamine; Alkenylation; Pyrrole

## 1. Introduction

The addition of an olefinic $\mathrm{C}-\mathrm{H}$ bond across an unsaturated carbon-carbon bond is highly interesting from the viewpoint of synthetic methodology [1]. The involvement of transition metal complexes in such processes is often crucial, particularly for the development of novel ways of $\mathrm{C}-\mathrm{C}$ bond formation [2]. We and other groups have discovered that cationic $\eta^{3}$-allenyl/ propargyl complexes generally behave as good carbon electrophiles and are subject to the addition with a wide variety of nucleophiles containing $\mathrm{O}, \mathrm{S}, \mathrm{Se}, \mathrm{N}, \mathrm{P}$ or C donor [3-7]. Meanwhile, such complexes exhibit keen chemical selectivity. For instance, tertiary amine such as $\mathrm{Et}_{3} \mathrm{~N}$ can be added to $\left[\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{3}-\mathrm{C}_{3} \mathrm{H}_{3}\right)\right]^{+}(\mathbf{3})$ via $\mathrm{C}-\mathrm{N}$ bond formation to give a platinacyclobutene adduct [8]. In contrast, compound $\mathbf{3}$ activates a phenyl $\mathrm{C}-\mathrm{H}$ bond in $\mathrm{NMe}_{2} \mathrm{Ph}$ to allow arylation, yielding an arylallyl complex [9].

We have chosen to use enamines that are known to contain both active $\mathrm{N}-\mathrm{H}$ as well as $\mathrm{C}-\mathrm{H}$ bonds to react with $\eta^{3}$ allenyl/propargyl complexes. Our studies lead to the discovery of the first examples of hydroalkenylation of metal complexes of allenyl/propargyl. The insertion of $\eta^{3}-\mathrm{C}_{3} \mathrm{H}_{3}$ to an enamine $\mathrm{C}-\mathrm{H}$ bond affords a diene 'skeleton' which allows incorporation of an amino functionality to form the pyrrole derivatives.

[^0]
## 2. Results and discussion

The enamines $\mathrm{Me}\left(\mathrm{NH}^{\mathrm{i}} \mathrm{Pr}\right) \mathrm{C}=\mathrm{CHR}[\mathrm{R}=\mathrm{COMe}(\mathbf{1 a})$, $\left.\mathrm{CO}_{2} \mathrm{Me}(\mathbf{1 b})\right]$ have been prepared by the reactions of $\alpha, \gamma-$ diketone or ketoester methane, respectively, with ${ }^{i} \mathrm{PrNH}_{2}$ [10]. The NMR data for compounds $\mathbf{1 a}$ and $\mathbf{1 b}$ indicate that tautomerization overwhelmingly inclines to the enamine form, which is presumably stabilized by hydrogen bonding between $\mathrm{N}-\mathrm{H}$ and the keto group:

Previous studies have shown that amines and amino derivatives with active hydrogen are prone to undergo regioselective hydroamination to $\left[\mathrm{M}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{3}-\mathrm{C}_{3} \mathrm{H}_{3}\right)\right]^{+} \quad[\mathrm{M}=\mathrm{Pd}$ (2), Pt (3)], yielding azatrimethylenemethane ( $\mathrm{N}-\mathrm{TMM}$ ) complexes and their derivatives ( $\mathrm{N}-\mathrm{TMM}$ represents the azatrimethylenemethane complexes $\mathrm{M}\left[\mathrm{CH}_{2} \mathrm{C}(\mathrm{NR}) \mathrm{CH}_{2}\right]$ ) [11]. However, heating a mixture of compounds $\mathbf{2}$ and $\mathbf{1 b}$ at $50^{\circ} \mathrm{C}$ was found to generate the pyrrole derivatives. Further investigation shows that reactions of equimolar amounts of compound 2 and enamine at $25^{\circ} \mathrm{C}$ undergo unprecedented hydroalkenylation. The regioselective $\mathrm{C}-\mathrm{C}$ coupling takes place between the central carbon of the $\mathrm{C}_{3} \mathrm{H}_{3}$ and the $\beta$ olefinic carbon of the enamine, and results in enamineallyl complexes of the formula of $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left\{\eta^{3}-\mathrm{CH}_{2} \mathrm{C}\right.$ -

Scheme 1.
$\left.\left[\mathrm{C}(\mathrm{COR}) \mathrm{CMe}\left(\mathrm{NH}^{\mathrm{i} P r}\right)\right] \mathrm{CH}_{2}\right\}^{+} \quad[\mathrm{R}=\mathrm{Me} \quad$ (4a), $\quad \mathrm{OMe}$ ( $\mathbf{4 b}$ )] with yields of over $75 \%$. Complexes $\mathbf{4 a}$ and $\mathbf{4 b}$ were characterized mainly by NMR techniques and elemental analysis. By heating the reaction solutions of complexes 4a and 4b to $50^{\circ} \mathrm{C}$, or treating them with base, yielded the pyrrole derivatives $\mathbf{6 a}$ and $\mathbf{6 b}$, respectively (Scheme 1 ).

The analogous reactions of $\left[\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{3}-\mathrm{C}_{3} \mathrm{H}_{3}\right)\right]\left(\mathrm{BF}_{4}\right)$ (3) with compound 1a or 1b produced $\left\{\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{2}{ }^{-}\right.$ $\left.\left(\eta^{3}-\mathrm{CH}_{2} \mathrm{C}\left[\mathrm{C}(\mathrm{COR})=\mathrm{CMe}\left(\mathrm{NH}^{\mathrm{i} P r}\right)\right] \mathrm{CH}_{2}\right)\right\}\left(\mathrm{BF}_{4}\right) \quad[\mathrm{R}=\mathrm{Me}$ $\left(\mathbf{4} \mathbf{a}^{\prime}\right)$, OMe ( $\left.\mathbf{4} \mathbf{b}^{\prime}\right)$ ], also in very good yields. The enamineallyl platinum complexes could alternatively be formed from the reactions of trans $-\mathrm{Pt}(\mathrm{Br})\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{1}-\mathrm{CHCCH}_{2}\right)$ and enamine at $25^{\circ} \mathrm{C}$, but with longer reaction time. Single-crystal X-ray crystallography provides the authentic molecular structure of $\mathbf{4} \mathbf{b}^{\prime}$. Fig. 1 shows its ORTEP drawing. The length of $\mathrm{C} 2-\mathrm{C} 4$ is 1.46 (2) $\AA$, a typical $\mathrm{C}_{\mathrm{sp}^{2}-\mathrm{C}_{\mathrm{sp}^{2}} \text { single bond. The }}$ dihedral angle between the $\mathrm{C} 1-\mathrm{C} 2-\mathrm{C} 3$ and $\mathrm{C} 1-\mathrm{Pt}-\mathrm{C} 2$ planes is $68(1)^{\circ}$ and $\angle \mathrm{C} 1-\mathrm{C} 2-\mathrm{C} 3$ is $113(1)^{\circ}$, which is consistent with the $\eta^{3}$-allyl characteristic and somewhat approaches that of the $\eta^{3}$-trimethylenemethane species [7,12]. This indicates that there is significant electronic delocalization in the planar $\mathrm{N}-\mathrm{C} 5-\mathrm{C} 4-\mathrm{C} 10-\mathrm{O} 1$ moiety of enamine. The distance between N and O 1 atoms is $2.52 \AA$, which is suitable for hydrogen bonding in the vicinity. However, the generated amino hydrogen points out of the enamine plane with $\angle \mathrm{O} 1-$ $\mathrm{H}-\mathrm{N}=116(7)^{\circ}$. The single crystals of compound $\mathbf{4} \mathbf{b}^{\prime}$ were obtained by recrystallization in $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{Et}_{2} \mathrm{O}$ solution. Crystal data: orthorhombic $P 2_{1} 2_{1} 2_{1} \quad a=11.100(5) \AA$, $b=17.764(4) \AA, c=21.951(4) \AA, V=4328(2) \AA^{3}, \mathrm{Mo} \mathrm{K} \alpha$ radiation $\lambda=0.7107 \AA, Z=4, \mu=3.398 \mathrm{~mm}^{-1}, 5490$ total reflections, 3032 observed reflections $(I>2.0 \sigma(I))$, $R=0.044, R_{\mathrm{w}}=0.036$.

Ring closure in compounds $\mathbf{4 a}$ and $\mathbf{4 b}$ could be accomplished by heating or treating with base as well, except that cyclization of compound $\mathbf{4 b}$ first generates a dihydropyrrole derivative (5b). Upon chromatographing on a silica gel column, $\mathbf{5 b}$ would isomerize to the stable pyrrole product ( $\mathbf{6 b}$ ). Such a reaction is mechanistically comparable to furan formation from an enolate-allyl complex [13].

## 3. Conclusions

The regioselective addition of enamine to $\eta^{3}$-allenyl/propargyl complexes demonstrates a new type of 'alkene-

Fig. 1. ORTEP drawing of $\left\{\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{3}-\mathrm{CH}_{2} \mathrm{C}\left[\mathrm{C}\left(\mathrm{CO}_{2} \mathrm{Me}\right)\right.\right.\right.$ $\left.\left.\left.\mathrm{CMe}\left(\mathrm{NH}^{\mathrm{i} P r}\right)\right] \mathrm{CH}_{2}\right)\right\}\left(\mathrm{BF}_{4}\right)\left(\mathbf{4 b}^{\prime}\right)$ with $50 \%$ probability ellipsoids. alkyne’ coupling which affords new enamine-allyl complexes and leads to the formation of pyrrole derivatives.

## 4. Experimental

### 4.1. General

Commercially available reagents were purchased and used without purification unless necessary. Solvents were dried using standard procedures. All reactions and other manipulations were carried out under a nitrogen atmosphere, using standard Schlenk techniques. The IR spectra were recorded on a Bio-Rad FTS-40 spectrophotometer. The NMR spectra were run on either a Bruker AC-200 or ACE-300 spectrometer. For the ${ }^{31} \mathrm{P}$ NMR spectra, the spectrometer frequency at 81.015 or 121.49 MHz was employed, and the chemical shifts are given in $\mathrm{ppm}(\delta)$ relative to $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$ in $\mathrm{CDCl}_{3}$. Values upfield of the standard are defined as negative. The corresponding frequencies for ${ }^{13} \mathrm{C}$ NMR spectra were at 75.47 MHz , respectively. Mass spectrometric (MS) data were collected on a JEOL SX-102A spectrometer. Elemental analyses were done on a Perkin-Elmer 2400 CHN analyzer.

### 4.2. Synthesis and characterization

### 4.2.1. $\left\{\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{3}-\mathrm{CH}_{2} \mathrm{C}\left[\mathrm{C}(\mathrm{COMe})=\mathrm{CMe}\left(\mathrm{NH}^{i} \mathrm{Pr}\right)\right]-\right.\right.$ $\left.\left.\mathrm{CH}_{2}\right)\right\}\left(\mathrm{BF}_{4}\right)(4 \boldsymbol{a})$

The reaction of compound $2(300 \mathrm{mg}, 0.39 \mathrm{mmol})$ and $(\mathrm{MeOC}) \mathrm{HC}=\mathrm{CMe}\left(\mathrm{NH}^{\mathrm{i}} \mathrm{Pr}\right)(1 \mathbf{1 a})(55 \mu \mathrm{l}, 0.039 \mathrm{mmol})$ was
carried out in 20 ml of predried $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $-30^{\circ} \mathrm{C}$. After stirring for 90 min , the solution was concentrated to 2 ml . Addition of 20 ml of dried $\mathrm{Et}_{2} \mathrm{O}$ gave a yellow solid product. Recrystallization resulted in compound $\mathbf{4 a}$ in $76 \%$ isolated yield ( 260 mg ). ${ }^{31} \mathrm{P}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta 23.8 .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta 1.21,1.24\left(3 \mathrm{H}, 3 \mathrm{H}, \mathrm{s}, \mathrm{s}, \mathrm{CH}_{3}\right)$, $2.00\left(6 \mathrm{H}, \mathrm{d}, J_{\mathrm{HH}}=6.9 \mathrm{~Hz}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 3.50(2 \mathrm{H}, \mathrm{m}, \mathrm{br}$, $\left.\mathrm{H}_{\text {anti }}\right), 3.69\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 4.12\left(2 \mathrm{H}, \mathrm{br}, \mathrm{H}_{\text {syn }}\right), 7.02-$ $7.73\left(30 \mathrm{H}, \mathrm{m}\right.$, phenyl H), $12.6\left(1 \mathrm{H}, \mathrm{d}, J_{\mathrm{HH}}=2.2 \mathrm{~Hz}, \mathrm{NH}\right)$. ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{3} \mathrm{CN}, 300 \mathrm{MHz}\right): \delta 18.4,23.7\left(\mathrm{CH}_{3}\right), 30.5$ $\left(\mathrm{CH}_{2}\right), 46.2\left(\mathrm{COCH}_{3}\right), 80.1$ (t with virtual coupling, $J_{\mathrm{CP}}=15.4 \mathrm{~Hz}, \mathrm{C}_{\mathrm{t}}$ ), 104.2 ( $\mathrm{C}_{\gamma}$ ), 129-134 (phosphino phenyl C), $146.1\left(\mathrm{C}_{\mathrm{c}}\right), 165.0(\mathrm{NC}=\mathrm{C}), 193.7$ ( COMe ). MS ( FAB , $m / z): 810\left(\mathrm{M}^{+}-\mathrm{BF}_{4}\right)$. Anal. Calc. for $\mathrm{PdC}_{47} \mathrm{H}_{48} \mathrm{NOP}_{2} \mathrm{BF}_{4}$ : C, 62.86; H, 5.38; N, 1.56. Found: C, 62.30; H, 5.04; N, $1.25 \%$.

### 4.2.2. $\left\{\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{3}-\mathrm{CH}_{2} \mathrm{C}\left[\mathrm{C}\left(\mathrm{CO}_{2} \mathrm{Me}\right)=\mathrm{CMe}\left(\mathrm{NH}^{i} \mathrm{Pr}\right)\right]-\right.\right.$ $\left.\left.\mathrm{CH}_{2}\right)\right\}\left(\mathrm{PF}_{6}\right)(4 \boldsymbol{b})$

Refer to compound $\mathbf{4 a}$ for the procedure. The reaction of compounds 2 ( $100 \mathrm{mg}, 0.12 \mathrm{mmol}$ ) and $\mathbf{1 b}$ ( $20 \mathrm{mg}, 0.15$ mmol ) gave a yellow solid product in $76 \%$ isolated yield ( 90 $\mathrm{mg})$. ### 4.2.3. $\left\{\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{3}-\mathrm{CH}_{2} \mathrm{C}\left[\mathrm{C}(\mathrm{COMe})=\mathrm{CMe}\left(\mathrm{NH}^{i} \mathrm{Pr}\right)\right]-\right.\right.$ $\left.\left.\mathrm{CH}_{2}\right)\right\}\left(P F_{6}\right)\left(4 \boldsymbol{a}^{\prime}\right)$

The reaction of compound $3(240 \mathrm{mg}, 0.28 \mathrm{mmol})$ and an equimolar amount of compound $\mathbf{1 a}$ produced compound $\mathbf{4 a} \mathbf{a}^{\prime}$ in $82 \%$ yield $(220 \mathrm{mg}) .{ }^{31} \mathrm{P}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta$ $18.1\left(J_{\text {PPt }}=3828 \mathrm{~Hz}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta 2.00$ $\left(6 \mathrm{H}, \mathrm{d}, J_{\mathrm{HH}}=6.9 \mathrm{~Hz}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 2.13,2.15(3 \mathrm{H}, 3 \mathrm{H}, \mathrm{s}, \mathrm{s}$, $\left.\mathrm{CH}_{3}\right), 3.33\left(2 \mathrm{H}, \mathrm{br}, \mathrm{H}_{\text {syn }}\right), 3.45\left(2 \mathrm{H}, \mathrm{dd}, J_{\mathrm{HP}}=8 \mathrm{~Hz}\right.$, $\left.J_{\mathrm{HPt}}=40.8 \mathrm{~Hz}, \mathrm{H}_{\mathrm{anti}}\right), 3.77\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 7.03-7.76$ $(30 \mathrm{H}, \mathrm{m}$, phenyl H$), 12.5\left(1 \mathrm{H}, \mathrm{d}, J_{\mathrm{HH}}=2.2 \mathrm{~Hz}, \mathrm{NH}\right) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta 15.2,23.4\left(\mathrm{CH}_{3}\right)$, $30.6\left(\mathrm{CH}_{2}\right)$, $45.4\left(\mathrm{COCH}_{3}\right), 69.6\left(\mathrm{~d}, J_{\mathrm{CP}}=34 \mathrm{~Hz}, J_{\mathrm{CPt}}=105 \mathrm{~Hz}, \mathrm{C}_{\mathrm{t}}\right)$, $103.7\left(J_{\mathrm{CPt}}=30 \mathrm{~Hz}, \mathrm{C}_{\gamma}\right), 128.0-133.9$ (phosphino phenyl C), $143.5\left(\mathrm{t}, J_{\mathrm{CP}}=4 \mathrm{~Hz}, J_{\mathrm{CPt}}=20.2 \mathrm{~Hz}, \mathrm{C}_{\mathrm{c}}\right), 165.1(\mathrm{NC}=\mathrm{C})$, 192.4 ( COMe). MS (FAB, $m / z$ ): $899\left(\mathrm{M}^{+}-\mathrm{BF}_{4}\right)$. Anal. Calc. for $\mathrm{PtC}_{47} \mathrm{H}_{48} \mathrm{NOP}_{2} \mathrm{BF}_{4}$ : C, 57.20; H, 4.90; N, 1.42. Found: C, 56.78; H, 4.04; N, 1.20\%.

### 4.2.4. $\left\{\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{3}-\mathrm{CH}_{2} \mathrm{C}\left[\mathrm{C}\left(\mathrm{CO}_{2} \mathrm{Me}\right)=\mathrm{CMe}\left(\mathrm{NH}^{i} \mathrm{Pr}\right)\right]-\right.\right.$ $\left.\left.\mathrm{CH}_{2}\right)\right\}\left(\mathrm{BF}_{4}\right)\left(4 \boldsymbol{b}^{\prime}\right)$

Complex 3 was first prepared from trans $-\mathrm{Pt}(\mathrm{Br})-$ $\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{3}-\mathrm{CHCCH}_{2}\right)(300 \mathrm{mg}, 0.36 \mathrm{mmol})$ and $\mathrm{AgBF}_{4}$
( $69 \mathrm{mg}, 0.36 \mathrm{mmol}$ ) in situ. The reaction of compounds 3 and $\mathbf{1 b}$ ( 0.36 mmol ) basically followed the procedure used for the preparation of compound $\mathbf{4 a}$ and produced $\mathbf{4 b}$ ' in $77 \%$ isolated yields ( 272 mg ). Colourless single crystals were obtained by recrystallization from $\mathrm{CH}_{2} \mathrm{CH}_{2}$-benzene. IR $(\mathrm{KBr})\left(\mathrm{cm}^{-1}\right): \nu_{\mathrm{CO}} 1634, \nu_{\mathrm{C}=\mathrm{C}} 1580 .{ }^{31} \mathrm{P}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $300 \mathrm{MHz}) \delta 19.6\left(J_{\mathrm{PPt}}=3845 \mathrm{~Hz},\right) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300\right.$ $\mathrm{MHz}): \delta 1.24\left(6 \mathrm{H}, \mathrm{d}, J_{\mathrm{HH}}=6.3 \mathrm{~Hz}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 2.20(3 \mathrm{H}$, $\left.J_{\mathrm{HPt}}=7.2 \mathrm{~Hz}, \mathrm{CH}_{3}\right), 3.10\left(2 \mathrm{H}, \mathrm{d}, J_{\mathrm{HH}}=8.6 \mathrm{~Hz}, J_{\mathrm{HPt}}=42 \mathrm{~Hz}\right.$, $\left.\mathrm{H}_{\text {anti }}\right), 3.20\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.63\left(2 \mathrm{H}, \mathrm{br}, \mathrm{H}_{\text {syn }}\right), 3.77(1 \mathrm{H}$, dhep, $\left.J_{\mathrm{HH}}=6.3,8.0 \mathrm{~Hz}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 7.0-7.6(30 \mathrm{H}, \mathrm{m}$, phenyl H), $10.4\left(1 \mathrm{H}, \mathrm{d}, J_{\mathrm{HH}}=8.0 \mathrm{~Hz}, \mathrm{NH}\right) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta 15.1\left(\mathrm{CH}_{3}\right)$, $22.6\left(\mathrm{~s},\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CH}\right)$, $45.4\left(\mathrm{dd}, J_{\mathrm{CP}}=5.8,14.2 \mathrm{~Hz},\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CH}\right), 50.9\left(\mathrm{OCH}_{3}\right)$, $67.6\left(\mathrm{~d}, J_{\mathrm{CP}}=32 \mathrm{~Hz}, J_{\mathrm{CPt}}=100 \mathrm{~Hz}, \mathrm{C}_{\mathrm{t}}\right), 91.6\left(J_{\mathrm{CPt}}=27 \mathrm{~Hz}\right.$, $\mathrm{MeC}=C$ ), 128.4-133.4 (phosphino phenyl C), 140.6 ( t , $\left.J_{\mathrm{CP}}=2.9 \mathrm{~Hz}, J_{\mathrm{CPt}}=18.4 \mathrm{~Hz}, \mathrm{C}_{\mathrm{c}}\right), 165.0\left(J_{\mathrm{CPt}}=19.0 \mathrm{~Hz}\right.$, $\mathrm{MeC}=\mathrm{C}), 169.1$ ( $\left.J_{\mathrm{CPt}}=11 \mathrm{~Hz}, \mathrm{CO}_{2} \mathrm{Me}\right)$. Anal. Calc. for $\mathrm{PtC}_{47} \mathrm{H}_{48} \mathrm{NO}_{2} \mathrm{P}_{2} \mathrm{BF}_{4}$ : C, 56.29; H, 4.83; N, 1.40. Found: C, 55.74; H, 4.91; N, 1.12\%.

### 4.2.5. 3-Carboxymethyl-2-methyl-4-methylene-Nisopropyldihydropyrrole (5b) <br> ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}, 200 \mathrm{MHz}\right): \delta 1.13\left(6 \mathrm{H}, \mathrm{d}, J_{\mathrm{HH}}=6.5 \mathrm{~Hz}\right.$, $\left.\mathrm{CH}_{3}\right), 2.31\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 3.61\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.01(1 \mathrm{H}, \mathrm{m}$, $\left.J_{\mathrm{HH}}=6.5 \mathrm{~Hz}, \mathrm{CH}\right), 4.18\left(2 \mathrm{H}, \mathrm{t}, J_{\mathrm{HH}}=3.4 \mathrm{~Hz}, \mathrm{CH}_{2}\right), 4.52$, $5.10\left(1 \mathrm{H}, 1 \mathrm{H}, \mathrm{dt}, J_{\mathrm{HH}}=1.5,3.4 \mathrm{~Hz},=\mathrm{CH}_{2}\right)$.

### 4.2.6. 3-Acetyl-2,4-dimethyl-N-isopropyldihydropyrrole ( $6 a$ )

A solution that contained compound $\mathbf{4 a}(30 \mathrm{mg})$ in 2 ml of chloroform was heated at $50^{\circ} \mathrm{C}$ for 24 h . The solution was then chromatographed on alumina and eluted with $\mathrm{Et}_{2} \mathrm{O}$. Compound 6a was obtained in $75 \%$ yield. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $200 \mathrm{MHz}): \delta 1.34\left(6 \mathrm{H}, \mathrm{d}, J_{\mathrm{HH}}=6.6 \mathrm{~Hz}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 2.38$, $2.47\left(3 \mathrm{H}, \mathrm{s}, \mathrm{s}, \mathrm{CH}_{3}\right), 4.28\left(1 \mathrm{H}, \mathrm{m}, J_{\mathrm{HH}}=6.6 \mathrm{~Hz}\right.$, $\left.\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 6.38(1 \mathrm{H}, \mathrm{s},=\mathrm{CH})$.

### 4.2.7. 3-Carboxymethyl-2,4-dimethyl-N-isopropylpyrrole (6b)

${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right): \delta 1.34\left(6 \mathrm{H}, \mathrm{d}, J_{\mathrm{HH}}=6.6\right.$ $\left.\mathrm{Hz}, \mathrm{CH}_{3}\right), 2.19\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.48\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 3.76(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{OCH}_{3}\right), 4.27\left(1 \mathrm{H}, \mathrm{m}, J_{\mathrm{HH}}=6.6 \mathrm{~Hz}, \mathrm{CH}_{2}\right), 6.38(1 \mathrm{H}, \mathrm{s}$, $=\mathrm{CH}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{~Hz}\right): 11.1,12.8,23.2,46.6$, 50.3, 114.0, 120.4, 128.4, 132.0, 166.9. HRMS: calc. for $\mathrm{C}_{11} \mathrm{H}_{17} \mathrm{NO}_{2}\left(\mathrm{M}^{+}\right)$194.1181; found 194.1180.

### 4.3. X-ray crystallographic analysis

Diffraction data were measured at 298 K on a Nonius CAD4 diffractometer with graphite-monochromatized $\mathrm{Mo} \mathrm{K} \alpha$ radiation. Cell parameters were determined by a least-squares fit on 25 reflections. Intensity data were corrected for absorption on the basis of an experimental $\psi$ rotation curve. The refinement procedure was by a full-matrix least-squares
method including all the non-hydrogenic atoms anisotropically. Hydrogen atoms were fixed at the ideal geometry and the C-H distance of $1.0 \AA$; their isotropic thermal parameters were fixed to the values of the attached carbon atoms at the convergence of the isotropic refinement. Atomic scattering factors were taken from international tables [14]. Computing programs are from the NRCC SDP VAX package [15]. Detailed data of compound $\mathbf{4} \mathbf{b}$ 'are supplied in the supplementary material.

## Supplementary data

Supplementary data are available from the CCDC, 12 Union Road, Cambridge CB2 1EZ, UK (fax: +44-1223336033; e-mail: deposit@ccdc.cam.ac.uk), on request, quoting deposition number 135924.
