#### Abstract

The $\eta^{1}$－thiocarbamoyl palladium complexes $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)\left(\eta^{2}-\mathrm{S}_{2} \mathrm{R}\right)\right]\left(\mathrm{R}=\mathrm{P}(\mathrm{OEt})_{2}, \mathbf{2} ; \mathrm{CNEt}_{2}, \mathbf{3}\right)$ and trans $-\left[\mathrm{Pd}_{( }\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)\left(\eta^{1}-\mathrm{Spy}\right)\right], 4$ ，（pyS：pyridine－2－thionate）are prepared by reacting the $\eta^{2}$－thiocarbamoyl palladium complex $\left[\mathrm{Pd}^{2}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{2}-\mathrm{SCNMe}_{2}\right)\right]\left[\mathrm{PF}_{6}\right]$ ， 1 with $(\mathrm{EtO})_{2} \mathrm{PS}_{2} \mathrm{NH}_{4}, \mathrm{Et}_{2} \mathrm{NCS}_{2} \mathrm{Na}$ ，and pySK in methanol at room temperature，respectively．Treatment of $\mathbf{1}$ with dppm（dppm：bis（diphenylphos－ phino）methane）in dichloromethane at room temperature gives complex $\left[\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)\left(\eta^{2}\right.\right.$－dppm $\left.)\right]$ $\left[\mathrm{PF}_{6}\right], \mathbf{5}$ ．All of the complexes are identified by spectroscopic methods and complex $\mathbf{1}$ is determined by sin－ gle－crystal X－ray diffraction．

Keywords：Thiocarbamoyl；Palladium，Crystal structure；Dithiocarbamate；Phosphorodithioate ligand．

## INTRODUCTION

The study of transition－metal compounds containing the $\mathrm{N}, \mathrm{N}$－dialkylthiocarbamoyl ligand $\left(-\mathrm{SCNR}_{2}\right)$ is of interest in that the ligand may act as a mono－or bidentate ligand，re－ sulting in novel structural and chemical features．${ }^{1}$ The inves－ tigation of transition－metal complexes with thiocarbonyl containing ligands ${ }^{2}$ and palladium derivatives are of interest because these systems may find applications as new homo－ geneous catalysts．Recently we have shown ${ }^{3}$ the dissocia－ tion of either the chloride or the triphenylphosphine ligand of complex $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)(\mathrm{Cl})\right]$ to form complex $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{2}-\mathrm{SCNMe}_{2}\right)\right][\mathrm{Cl}]$ or the dipalladium complex $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right) \mathrm{Cl}\right]_{2}\left(\mu, \eta^{2}-\mathrm{SCNMe}_{2}\right)_{2}$ ．

To understand the electrophilic reactivity and the coor－ dination mode of the $\mathrm{Me}_{2} \mathrm{NCS}$ ligand，herein，we report the results of thio and diphos ligands addition to complex［Pd－ $\left.\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{2}-\mathrm{SCNMe}_{2}\right)\right]\left[\mathrm{PF}_{6}\right]$ and its crystal structure．

## RESULTS AND DISCUSSION

In an early study，${ }^{3}$ we described the synthesis and X－ray crystallography of the $\eta^{1}$－thiocarbamoyl palladium complex $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)(\mathrm{Cl})\right]$ ．Treatment of $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{1}-\right.\right.$
$\left.\mathrm{SCNMe}_{2}\right)(\mathrm{Cl})$ ］with $\mathrm{NH}_{4} \mathrm{PF}_{6}$ in acetone at room temperature resulted in chloride abstraction reaction，affording the $\eta^{2}$－ thiocarbamoyl palladium complex $\left[\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{2}-\mathrm{SCNMe}_{2}\right)\right]$ ［ $\left.\mathrm{PF}_{6}\right]$ ， 1 with $92 \%$ isolate yield（Scheme I）．The air－stable yel－ low compound $\mathbf{1}$ is soluble in DMSO， $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{CH}_{3} \mathrm{CN}$ and insoluble in $\mathrm{MeOH}, n$－hexane，and diethyl ether．The analytical data of $\mathbf{1}$ are in good agreement with the formula－ tion．In the FAB mass spectra，one base peak with the typical Pd isotope distribution is in agreement with the $\left[\mathrm{M}^{+}-\mathrm{PF}_{6}\right]$ molecular mass of $\mathbf{1}$ ．The IR spectrum of $\mathbf{1}$ shows four stretchings at $1630 \mathrm{~cm}^{-1}$ for $\mathrm{C}=\mathrm{N}$ ，at 1481 and $1437 \mathrm{~cm}^{-1}$ for $\mathrm{C}=\mathrm{S}$ ，and at $839 \mathrm{~cm}^{-1}$ for $\mathrm{PF}_{6}$ group．In the ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1}$ ，the two methyl protons of the $\mathrm{SCNMe}_{2}$ ligand exhibit two resonances at $\delta 2.45$ and $\delta 3.61$ ．In the ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum of $\mathbf{1}$ ，two singlet resonances appear at $\delta 45.9$ and $\delta$ 53.9 and one doublet resonance appears at $\delta 212.1\left({ }^{2} J_{\mathrm{P}-\mathrm{C}}=\right.$ 6．7）for the carbon atom of the two methyl and thiocarbamoyl group，respectively．The ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum of $\mathbf{1}$ shows two doublet resonances at $\delta 23.1$ and $\delta 35.1$ due to the chemi－ cal inequivalence of the two $\mathrm{PPh}_{3}$ ligands and the relative downfield resonance compared to that of the starting com－ plex $\left[\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)(\mathrm{Cl})\right](\delta 16.6)$ which shows the cationic character of $\mathbf{1}$ ．From the description，it is clear that the palladium of $\mathbf{1}$ is side－on bound through the C－S moiety of the $\mathrm{SCNMe}_{2}$ ligand．

[^0]
## Scheme I

To confirm the $\eta^{2}$-thiocarbamoyl coordination mode, a single crystal of $\mathbf{1}$ suitable for X-ray diffraction study was grown by slow $n$-hexane diffusion into a dichloromethane solution at $4^{\circ} \mathrm{C}$. An ORTEP plot of $\mathbf{1}$ is shown in Fig. 1. In complex 1 , the Pd atom and its neighboring atoms, $\mathrm{P}(1), \mathrm{P}(2)$, $\mathrm{S}(1)$ and $\mathrm{C}(1)$ lie in a distorted squared plane. The distortion

Fig. 1. An ORTEP drawing with $30 \%$ thermal ellipsoids and atom-numbering scheme for the cationic complex $\left[\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{2}-\mathrm{SCNMe}_{2}\right)\right]$ $\left[\mathrm{PF}_{6}\right], 1$.
is mainly due to the short bite of the $\mathrm{C}=\mathrm{S}$ linkage [ $\mathrm{C}-\mathrm{Pd}-\mathrm{S}$, $\left.44.54(16)^{\circ}\right]$. A least-squares plane calculation reveals the planarity of the $\mathrm{P}(2) \mathrm{P}(1) \mathrm{C}(1) \mathrm{S}(1)$ core (largest deviation $0.031(1) \AA)$. The $\mathrm{C}(1)-\mathrm{S}(1)$ bond distance of $1.667(6) \AA$ is similar to the corresponding carbon-sulfur bond distance observed in $\eta^{2}-\mathrm{CS}_{2}\left(\mathrm{sp}^{2}\right)$ transition-metal complexes [1.65(3) $\AA$ in $\left[\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Pd}\left(\eta^{2}-\mathrm{CS}_{2}\right)\right] .{ }^{4}$ The $\mathrm{Pd}-\mathrm{S}(1)$ distance of 2.3243(5) $\AA$ is within the normal Pd-S length range (2.23~2.32 $\AA$ ). ${ }^{5}$ Within the $\mathrm{SCNMe}_{2}$ ligand itself, the geometry is consistent with significant partial double bond character in the C-S and SC-N bond. Thus, the C-S bond distance (1.667(6) $\AA$ ) is comparable to the C-S double bond in ethylenethiourea, although they are longer than those in free $\mathrm{CS}_{2}(1.554 \AA)$. The SC-N bond distance (1.303(7) $\AA$ ) is typical for a C-N bond having partial double bond character and is certainly much shorter than the normal C-N $(1.47 \AA)$ single bond. The Me-N distance is normal for a single bond.

Treatment of $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{2}-\mathrm{SCNMe}_{2}\right)\right]\left[\mathrm{PF}_{6}\right]$, $\mathbf{1}$ with $(\mathrm{EtO})_{2} \mathrm{PS}_{2} \mathrm{NH}_{4}$ in methanol for 10 min yields complex [Pd-$\left.\left(\mathrm{PPh}_{3}\right)\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)\left\{\eta^{2}-\mathrm{S}_{2} \mathrm{P}(\mathrm{OEt})\right\}\right]$, $\mathbf{2}$ in $75 \%$ yield exclusively (Scheme I). Compound $\mathbf{2}$ is an air-stable, yellow solid and is readily soluble in polar organic solvents such as dichloromethane and acetonitrile but is insoluble in diethyl ether and $n$-hexane.

The identification of $\mathbf{2}$ as $\left[\mathrm{Pd}_{\left(\mathrm{PPh}_{3}\right)\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)\left(\eta^{2}-\right.}\right.$
$\left.\left.\mathrm{S}_{2} \mathrm{P}(\mathrm{OEt})_{2}\right)\right]$ is according to the spectroscopic data. The FAB mass spectrum of $\mathbf{2}$ shows a base peak at $m / z=642$ which corresponds to the molecular mass of $\mathbf{2}$. In the ${ }^{1} \mathrm{H}$ NMR spectrum, the methyl protons and ethoxy protons are observed at $\delta$ $2.93,3.30$ and at $\delta 1.37,4.24\left(J_{\mathrm{H}-\mathrm{H}}=6.95\right)$, respectively, and the corresponding resonances in the ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum appear at $\delta 41.8,47.1$ and at $\delta 15.7,64.2,64.5$, respectively. Notably, the relative down field ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ resonance of the carbon atom of the thiocarbonyl reveals the $\eta^{1}$-thiocarbamoyl property. The ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR resonances of $\mathbf{2}$ appear at $\delta$ $100.4\left(\mathrm{PS}_{2}\right)$ and $\delta 23.9\left(\mathrm{PPh}_{3}\right)$ with a ratio of $1: 1$ from the integration of the ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectra. From the above description, it is clear that the phosphorodithioate ligand, $(\mathrm{EtO})_{2} \mathrm{PS}_{2}^{-}$, coordinated to the palladium through the two sulfur atoms.

The same procedure was used to prepare other thiocarbamoyl thio-complexes $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)\left(\eta^{2}-\mathrm{S}_{2} \mathrm{CNEt}_{2}\right)\right]$, 3 and trans $-\left[\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)\left(\eta^{1}-\mathrm{Spy}\right)\right], 4$ with $69 \%$ and $86 \%$ yields, respectively. In the FAB mass spectra, two base peaks with the typical Pd isotope distribution are respectively in agreement with the $\left[\mathrm{M}^{+}-\mathrm{BF}_{4}\right]$ and the $\left[\mathrm{M}^{+}\right.$- pyS] molecular masses of $\mathbf{3}$ and $\mathbf{4}$. The ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectra of $\mathbf{3}$ ( $\delta 25.3$ ) and 4 ( $\delta 20.9$ ) are similar to that of the neutral complex 2. The $\eta^{1}$-pyS mode of $\mathbf{4}$ was formed due to its chelating ability being less than those of the $\mathrm{S}_{2} \mathrm{CNEt}_{2}$ and $\mathrm{S}_{2} \mathrm{P}(\mathrm{OEt})_{2}$ ligands.

Treatment of $\left[\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{2}-\mathrm{SCNMe}_{2}\right)\right]\left[\mathrm{PF}_{6}\right]$, $\mathbf{1}$ with dppm in dichloromethane for 10 min yields complex [Pd-$\left(\mathrm{PPh}_{3}\right)\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)\left(\eta^{2}\right.$-dppm $\left.)\right]\left[\mathrm{PF}_{6}\right], 5$ with $78 \%$ isolate yield (Scheme I). The FAB mass spectrum of $\mathbf{5}$ shows a base peak at $m / z=578$ which corresponds to a fragment formed by loss of the $\mathrm{PPh}_{3}$ group from $\mathbf{5}$. The IR spectrum of $\mathbf{5}$ is similar to that of $\mathbf{1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{5}$ exhibits two singlet resonances at $\delta 2.15,3.74$ and one triplet resonance at $\delta 2.68$ assignable to the N -methyl and P -methylene protons, respectively. The corresponding ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR signals appear at $\delta$ $34.3,45.2$ and $\delta 30.9$, respectively. In the ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum of 5, three doublets of doublet resonances at $\delta 4.51,11.4$ and $\delta 29.6$ with ratios of 1:1:1 are assigned to the dppm and $\mathrm{PPh}_{3}$ ligands, respectively, that indicates the $\eta^{2}$-P-coordination of the dppm ligand. Attempted reactions of complex 1 with KSCN and bipy gave no reaction but with $\mathrm{NH}_{2} \mathrm{CH}_{2} \mathrm{C} \equiv \mathrm{CH}$ gave more than ten complexes, although this reaction was not pursued further.

We employ thio and dppm ligands addition to the thiocarbamoyl palladium complex to investigate the thiocarbamoyl bonding modes. $\eta^{1}$-Thiocarbamoyl bonding mode is observed in the dithiophosphate, dithiocarbamate, and dppm
ligands. Crystal structure of $\mathbf{1}$ confirms the $\eta^{2}$-thiocarbamoyl bonding mode.

## EXPERIMENTAL SECTION

## General Procedures

All manipulations were performed under nitrogen using vacuum-line and standard Schlenk techniques. NMR spectra were recorded on an AM-500 WB FT-NMR spectrometer and are reported in units of parts per million with residual protons in the solvent as an internal standard $\left(\mathrm{CDCl}_{3}, \delta\right.$ 7.24). IR spectra were measured on a Nicolate Avator-320 instrument and referenced to polystyrene standard, using cells equipped with calcium fluoride windows. MS spectra were recorded on a JEOL SX-102A spectrometer. Solvents were dried and deoxygenated by refluxing over the appropriate reagents before use. $n$-Hexane and diethyl ether were distilled from sodium-benzophenone. Acetonitrile and dichloromethane were distilled from calcium hydride, and methanol was distilled from magnesium. All other solvents and reagents were of reagent grade and used as received. Elemental analyses and X-ray diffraction studies were carried out at the Regional Center of Analytical Instruments located at National Taiwan University. $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ was purchased from Strem Chemical; (EtO) $)_{2} \mathrm{PS}_{2} \mathrm{NH}_{4}, \mathrm{Et}_{2} \mathrm{NCS}_{2} \mathrm{Na}$, pySH, and dppm were purchased from Merck.

## Preparation of $\left[\mathbf{P d}\left(\mathbf{P P h}_{3}\right)_{2}\left(\eta^{2}-\mathrm{SCNMe}_{2}\right)\right]\left[\mathrm{PF}_{6}\right], \mathbf{1}$

Acetone $(20 \mathrm{~mL})$ was added to a flask $(100 \mathrm{~mL})$ containing $\mathrm{NH}_{4} \mathrm{PF}_{6}(0.163 \mathrm{~g}, 1.0 \mathrm{mmol})$ and $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{1}-\right.\right.$ $\left.\left.\mathrm{SCNMe}_{2}\right)(\mathrm{Cl})\right](0.754 \mathrm{~g}, 1.0 \mathrm{mmol})$. The solution was stirred for 5 min at room temperature. The solvent was then removed under vacuum. The remaining solid was dissolved in 10 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the solution was filtered to remove excess $\mathrm{NH}_{4} \mathrm{Cl}$. The solution was concentrated under vacuum and $n$-hexane ( 10 mL ) was added to initiate precipitation. The yellow-orange solids $\mathbf{1}$ were formed which were isolated by filtration (G4), washed with $n$-hexane ( $2 \times 10 \mathrm{~mL}$ ) and subsequently dried under vacuum yielding $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2}\left(\eta^{2}-\right.\right.$ $\left.\left.\mathrm{SCNMe}_{2}\right)\right]\left[\mathrm{PF}_{6}\right], \mathbf{1}(0.79 \mathrm{~g}, 92 \%)$. Further purification was accomplished by recrystallization from $1 / 10 \mathrm{CH}_{2} \mathrm{Cl}_{2} / n$-hexane. Spectroscopic data of $\mathbf{1}$ are as follows. IR $\left(\mathrm{KBr}, \mathrm{cm}^{-1}\right) \cup(\mathrm{CN})$ 1630 (m); v (CS) 1481 (m), 1437 (m); v ( $\mathrm{PF}_{6}$ ) 839 (vs). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, 298 \mathrm{~K}$ ): $\delta 2.45$, 3.61 (s, $6 \mathrm{H}, \mathrm{NCH}_{3}$ ), 7.24-7.73 (m, 30H, Ph). ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $202 \mathrm{MHz}, \mathrm{CDCl}_{3}$, $298 \mathrm{~K}): \delta 23.2,34.8\left(\mathrm{~d}, \mathrm{PPh}_{3},{ }^{2} J_{\mathrm{P}-\mathrm{P}}=40.7\right),-144.0\left(\mathrm{sep}, \mathrm{PF}_{6}\right.$,
$\left.J_{\text {P-F }}=708.6\right) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}, 298 \mathrm{~K}$ ): $\delta$ 45.9, 53.9 (s, $\mathrm{NCH}_{3}$ ), 128.8-134.0 (m, C of Ph), 212.1 (d, CS, ${ }^{2} J_{\mathrm{P}-\mathrm{C}}=6.7$ ). MS (FAB, NBA, $m / z$ ): $718\left[\mathrm{M}^{+}-\mathrm{PF}_{6}\right], 630\left[\mathrm{M}^{+}-\right.$ $\left.\mathrm{PF}_{6}-\mathrm{CSNMe}_{2}\right], 456\left[\mathrm{M}^{+}-\mathrm{PF}_{6}-\mathrm{PPh}_{3}\right]$. Anal. Calcd. for $\mathrm{C}_{39} \mathrm{H}_{36} \mathrm{~F}_{6} \mathrm{NP}_{3} \mathrm{SPd}: \mathrm{C}, 54.21$; H, 4.20 ; N, $1.62 \%$. Found: C, 54.18; H, 4.46; N, 1.51.

Preparation of $\left[\mathbf{P d}\left(\mathrm{PPh}_{3}\right)\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)\left\{\eta^{2}-\mathrm{S}_{2} \mathbf{P}(\mathrm{OEt})_{2}\right\}\right]$, 2
$\mathrm{MeOH}(20 \mathrm{~mL})$ was added to a flask $(100 \mathrm{~mL})$ containing (EtO) $)_{2} \mathrm{PS}_{2} \mathrm{NH}_{4}(0.203 \mathrm{~g}, 1.0 \mathrm{mmol})$ and $1(0.863 \mathrm{~g}, 1.0$ mmol ). The solution was stirred for 10 min , and the yelloworange solids $\mathbf{2}$ were formed which were isolated by filtration (G4), washed with $n$-hexane $(2 \times 10 \mathrm{~mL})$ and subsequently dried under vacuum yielding $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)\left\{\eta^{2}-\right.\right.$ $\left.\left.\mathrm{S}_{2} \mathrm{P}(\mathrm{OEt})_{2}\right\}\right]$, $2(0.48 \mathrm{~g}, 75 \%)$. Further purification was accomplished by recrystallization from $1 / 10 \mathrm{CH}_{2} \mathrm{Cl}_{2} / n$-hexane. Spectroscopic data of $\mathbf{2}$ are as follows. IR $\left(\mathrm{KBr}, \mathrm{cm}^{-1}\right) \cup(\mathrm{CS})$ 1480 (m), 1430 (m). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, 298 \mathrm{~K}$ ): $\delta$ $1.37\left(\mathrm{t}, 6 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{CH}_{3}, J_{\mathrm{H}-\mathrm{H}}=6.95\right), 2.93,3.30\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{NCH}_{3}\right)$, $4.24\left(\mathrm{q}, 4 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{CH}_{3}, J_{\mathrm{H}-\mathrm{H}}=6.95\right), 7.24-7.59(\mathrm{~m}, 15 \mathrm{H}, \mathrm{Ph})$. ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $202 \mathrm{MHz}, \mathrm{CDCl}_{3}, 298 \mathrm{~K}$ ): $\delta 23.9\left(\mathrm{~s}, \mathrm{PPh}_{3}\right)$, 100.4 (s, $\mathrm{PS}_{2}$ ). ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}, 298 \mathrm{~K}$ ): $\delta$ $15.7\left(\mathrm{~s}, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 41.8,47.1\left(\mathrm{~s}, \mathrm{NCH}_{3}\right), 64.2,64.5(\mathrm{~s}$, $\mathrm{OCH}_{2} \mathrm{CH}_{3}$ ), 128.2-134.4 (m, C of Ph), 225.1 ( $\mathrm{s}, \mathrm{NCS}$ ). MS (FAB, NBA, $m / z$ ): $642\left[\mathrm{M}^{+}\right], 553\left[\mathrm{M}^{+}-\mathrm{CSNMe}_{2}\right]$. Anal. Preparation of $\left[\mathbf{P d}\left(\mathrm{PPh}_{3}\right)\left(\eta^{1}-\mathrm{SCNMe}_{2}\right)\left(\eta^{2}\right.\right.$-dppm $\left.)\right]\left[\mathrm{PF}_{6}\right], 5$
$\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ was added to a flask $(100 \mathrm{~mL})$ containing $1(0.863 \mathrm{~g}, 1.0 \mathrm{mmol})$ and $\mathrm{dppm}(0.384 \mathrm{~g}, 1.0 \mathrm{mmol})$. The solution was stirred for 10 min at room temperature. $n$-Hexane $(15 \mathrm{~mL})$ was added to the solution and a yellow precipitate was formed. The precipitate was collected by filtration (G4), washed with $n$-hexane ( $2 \times 10 \mathrm{~mL}$ ) and then dried in vacuo yielding $0.77 \mathrm{~g}(78 \%)$ of $\mathbf{5}$. Spectroscopic data of $\mathbf{5}$ are as follows. IR ( $\mathrm{KBr}, \mathrm{cm}^{-1}$ ) $\cup(\mathrm{CN}) 1633(\mathrm{~m}) ; v(\mathrm{CS}) 1485(\mathrm{~m})$, 1438 (m); v ( $\mathrm{PF}_{6}$ ) 841 (vs). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, 298$ $\mathrm{K}): \delta 2.15,3.73\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{NCH}_{3}\right), 2.68\left(\mathrm{t}, 2 \mathrm{H}, \mathrm{PCH}_{2}, J_{\mathrm{P}-\mathrm{H}}=\right.$ 5.38), 7.00-7.92 (m, 35H, Ph). ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( 202 MHz , $\left.\mathrm{CDCl}_{3}, 298 \mathrm{~K}\right): \delta 4.51,11.4\left(\mathrm{dd}, \mathrm{PPh}_{2},{ }^{2} J_{\mathrm{P}-\mathrm{P}}=25.4,24.2\right), 29.6$ (dd, $\left.\mathrm{PPh}_{3}, J_{\mathrm{P}-\mathrm{P}}=25.4,24.2\right) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( 125 MHz , $\left.\mathrm{CDCl}_{3}, 298 \mathrm{~K}\right): \delta 30.9\left(\mathrm{~m}, \mathrm{CH}_{2}\right), 34.3,45.2\left(\mathrm{~s}, \mathrm{NCH}_{3}\right)$, 128.4-137.1 (m, C of Ph). ## Single-Crystal X-ray Diffraction Analysis of 1

A single crystal of $\mathbf{1}$ suitable for X-ray diffraction analysis was grown by recrystallization from 20:1 $n$-hexane/ $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The diffraction data were collected at room temperature on an Enraf-Nonius CAD4 diffractometer equipped with graphite-monochromated $\operatorname{Mo} \mathrm{K} \alpha(\lambda=0.71073 \AA)$ radiation. The raw intensity data were converted to structure factor amplitudes and their esd's after correction for scan speed, background, Lorentz, and polarization effects. An empirical absorption correction, based on the azimuthal scan data, was applied to the data. Crystallographic computations were carried out on a Microvax III computer using the NRCC-SDP-VAX structure determination package. ${ }^{6}$

A suitable single crystal of $\mathbf{1}$ was mounted on the top of a glass fiber with glue. Initial lattice parameters were determined from 24 accurately centered reflections with $\theta$ values in the range from 1.44 to $27.50^{\circ}$. Cell constants and other pertinent data were collected and are recorded in Table 1. Reflection data were collected using the $\theta / 2 \theta$ scan method. Three

check reflections were measured every 30 min throughout the data collection and showed no apparent decay. The merging of equivalent and duplicate reflections gave a total of 27983 unique measured data in which 9389 reflections with I > $2 \sigma(\mathrm{I})$ were considered observed. The structure was first solved by using the heavy-atom method (Patterson synthesis), which revealed the positions of metal atoms. The remaining atoms were found in a series of alternating difference Fourier maps and least-squares refinements. The quantity minimized by the least-squares program was $\omega\left(\left|\mathrm{F}_{\mathrm{o}}\right|-\left|\mathrm{F}_{\mathrm{c}}\right|\right)^{2}$, where $\omega$ is the weight of a given operation. The analytical forms of the scattering factor tables for the neutral atoms were used. ${ }^{7}$ The non-hydrogen atoms were refined anisotropically. Hydrogen atoms were included in the structure factor calculations in their expected positions on the basis of idealized bonding geometry but were not refined in least squares. All hydrogens were assigned isotropic thermal parameters 1-2 $\AA^{2}$ larger then the equivalent Biso value of the atom to which they were bonded. The final residuals of this refinement were $R=0.064$ and $R w=0.148$. Selected bond distances and angles are listed in Table 2. Tables of thermal parameters and selected final atomic coordinates are given in

Table 2. Selected Interatomic Distances $(\AA)$ and Angles (deg) for $\mathbf{1}$

| bond lengths |  | bond angles |  |
| :--- | :--- | :--- | :--- |
