#### Abstract

Twenty-seven sesquiterpenes were isolated from leaves of Cryptomeria japonica. The new compounds included elem-l-en-4,11-diol, 11-acetoxyeudesman-4 $\alpha$-ol, eudesmane- $5 \alpha, 11$-diol, 3 -eudesmene- $1 \beta, 11$-diol, $1 \beta$-acetoxy-3-eudesmen-11-ol, 4-eudesmene-1 $\beta, 11$-diol, $1 \beta$-acetoxy-4-eudesmen-11-ol, 7-epi- $\gamma$-eudesmol, 7-epi-4-eudesmene$1 \beta, 11$-diol, $1 \beta$-acetoxy-4(15)-eudesmen-11-ol. Their structures were determined by chemical and spectral methods.

## INTRODUCTION

The Japanese cedar, Cryptomeria japonica D. Don., is a widely distributed conifer called 'sugi' in Japanese. We recently reported the isolation and structural determination of chamaecydin triterpene [1], abietane, kaurane and labdane diterpenes $[2,3]$ from the ethyl acetatesoluble part of the leaves of C. japonica. As a continuation of this study, we describe herein, 27 constituents of sesquiterpenes including 10 novel compounds 5, 8, 9, 11, 12, 14-17, and 23.

## RESULTS AND DISCUSSION

The leaves of $C$. japonica were extracted with acetone. The ethyl acetate-soluble portion of the extract was subjected to chromatography to give sesquiterpenes 1-27. The known compounds epitodomatuic acid (1) [4], epijuvabione (2) [4], 11-hydroxy-4,5-secoeudesmane-4,5dione (3) [5], elemol (4) [6], cryptomeridiol (6) [7], 4epicryptomeridiol (7) [8], $\alpha$-eudesmol (10) [9, 10], $\gamma$ eudesmol (13) [9], 6-eudesmene-1 $\beta, 4 \beta$-diol (18) [11], oplodiol (19) [10, 12], $\beta$-eudesmol (20) [13], 4(15)-eudesmene-1 $\beta, 11$-diol (21) [14], 4(15)-eudesmene-1 $\beta, 6 \alpha$ diol (22) [15, 16], $\alpha$-cadinol (24) [17], T-cadinol (25) [18], oplopanone (26) [19] and cedrol (27) [20] were identified by comparison of their physical and spectral data (mp, [ $\alpha$ ], mass, IR, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{CNMR}$ ) with literature.

The molecular formula, $\mathrm{C}_{15} \mathrm{H}_{28} \mathrm{O}_{2}$, of 5 was inferred from its exact mass 240.209 . The ${ }^{13} \mathrm{C}$ NMR spectrum showed signals for a terminal double bond at $\delta 153.3$ (d) and $109.5(t)$. The signals for two isopropanol moieties appeared at $\delta 1.17(\mathrm{Me}), 1.18(3 \mathrm{Me}), 72.7(s)$ and $75.4(\mathrm{~s})$. The proton resonance at $\delta 1.57$ was assigned to $\mathrm{H}-5$ by means of C-H COSY and HMBC. As H-5 appeared as a double of doublet ( $J=12,3 \mathrm{~Hz}$ ), it was in the axial

[^0]orientation. Compound 5 had chemical shifts for C-7 and C-10 at $\delta 49.5$ (d) and $40.3(s)$, close to the values for those signals in elemol. The structure of 5 was determined to be elem-1-en-4,11-diol and its ( $5 R, 7 R, 10 S$ )-configuration was tentatively assigned by analogy to that of elemol. Compound 5 was unstable in $\mathrm{CDCl}_{3}$ solution. A product 5a, (1S)-elemane-1,4,11-triol, was obtained presumably by the acid-catalysed hydration of 5 . The $S$-configuration was determined by Horeau's method [21]. Compound 5 can be also regarded as a hydration derivative of elemol (4).

From spectral analyses, $8\left(\mathrm{C}_{17} \mathrm{H}_{30} \mathrm{O}_{3}\right)$ was readily determined to be 11 -acetoxyeudesman- $4 \alpha$-ol. It showed the IR absorption at $1723 \mathrm{~cm}^{-1}$ and carbon resonances at $\delta 22.4$ and 170.5 for the acetoxy group. The structure of 8 was confirmed as it was saponified to yield cryptomeridiol (6). Two $\mathrm{C}-11$ methyl groups in 6 appearing at $\delta 1.16$ were deshielded to $\delta 1.40$ and 1.43 in 8 as the $\mathrm{C}-11$ hydroxyl group was converted to the acetoxy group.

An eudesmanediol (9) $\left(\mathrm{C}_{15} \mathrm{H}_{28} \mathrm{O}_{2}\right)$ exhibited the parent peak in the mass spectrum at $m / z 240.209$. The $\mathrm{C}-\mathrm{H}$ COSY and HMBC experiments led to the assignment of 9 as eudesmane-5 $\alpha, 11$-diol. Irradiation of $\mathrm{Me}-10$ (at $\delta 0.93$ ) caused $7 \%$ NOE of Me-4 (at $\delta 0.81$ ) and $10 \%$ NOE of H$6 \beta$ (at $\delta 1.28$ ). The signal of $\mathrm{H}-6 \alpha$ appeared at a relatively low field $\delta 1.72$ presumably due to the deshielding effect of the $5 \alpha$-hydroxyl group. The large coupling constant 12.5 Hz between $\mathrm{H}-6 \beta$ and $\mathrm{H}-7$ was in agreement with their axial positions.

Based on the spectral analyses, two isomers $\left(\mathrm{C}_{15} \mathrm{H}_{26} \mathrm{O}_{2}\right) 11$ and 14 , were assigned as 3 -eudesmene$1 \beta, 11$-diol and 4-eudesmene-1 $\beta, 11$-diol, respectively. Two olefinic carbons in 11 occurred at $\delta 119.5(d)$ and $135.4(s)$, whereas those in 14 appeared at $\delta 123.8(\mathrm{~s})$ and 133.6 (s). The $\mathrm{H}-1$ in 11 was axially oriented to exhibit its resonance as a double of doublet (at $\delta 3.50$ ) with 10 and 6.5 Hz coupling constants. The resonance of $\mathrm{H}-1$ in 14 also showed a similar pattern ( $d d, J=9,7 \mathbf{H z}$ ). An allylic

proton H-5 appearing at $\delta 1.66(d d, J=9,3 \mathrm{~Hz})$ also conformed to the trans-fused configuration of 11 . The C-7 resonances of 11 and 14 occurred at $\delta 49.2$ and 49.7 close to the value of C-7 ( $\delta 50.0$ ) in $\alpha$-eudesmol (10).

Compounds 12 and 15 are $1 \beta$-acetoxy-3-eudesmen-11ol and $1 \beta$-acetoxy-4-eudesmen- 11 -ol, the acetates of 11 and 14, respectively. Due to the inductive effect of acetoxy groups, the $\mathrm{H}-1$ resonances in 12 and 15 occurred at low fields $\delta 4.74(d d, J=9.5,6.5 \mathrm{~Hz})$ and $4.67(d d, J=8,8 \mathrm{~Hz})$.

Saponification of 12 and 15 gave, respectively, the corresponding diol 11 and 14.

Compounds $16\left(\mathrm{C}_{15} \mathrm{H}_{26} \mathrm{O}\right)$ and $17\left(\mathrm{C}_{15} \mathrm{H}_{26} \mathrm{O}_{2}\right)$ were determined to be 7 -epi- $\gamma$-eudesmol and 7-epi-4-eudesmene- $1 \beta, 11$-diol, respectively. The coupling constants between the C-7 and C-6 protons were small ( $2-3.5 \mathrm{~Hz}$ ) as the C-7 protons were on equatorial positions. The C-7 signals in 16 and 17 appeared at $\delta 44.1$, whereas those signals in their 7 -epimers 13 and 14

*Some assignable resonances for 8 appeared at $\delta 0.84(s, H-14), 1.08(s, H-15), 1.40(s, H-12), 1.43(s, H-13), 1.94(s, O A c)$ in addition to others.
appeared at lower fields ( $\Delta \delta=5 \mathrm{ppm}$ ) [22]. In contrast, the C -11 signals of the isopropanol moieties in 16 and 17 occurred at lower fields than those in 13 and 14.
Compound 23 showed IR absorption at 3453 (broad) and $1711 \mathrm{~cm}^{-1}$ attributable to hydroxyl and acetyl groups. The exact mass at $m / z 280.202$ indicated the molecular formula $\mathrm{C}_{17} \mathrm{H}_{28} \mathrm{O}_{3}$ and an intense signal at $\mathrm{m} / \mathrm{z} 202$ was attributable to the fragment derived by elimination of water and acetic acid $\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right.$ $-\mathrm{HOAc}]^{+}$. By analysis of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra, the structure of 23 was determined to be $1 \beta$-acetoxy-4-(15)-eudesmen-11-ol. To confirm this structural assignment, $\mathbf{2 3}$ was saponified to give the eudesmenediol 21.
In summary, a series of known and new sesquiterpenes were isolated from the leaves of C. japonica. The structures of new sesquiterpenes were determined by analyses of their spectra. The acetates $8,12,15$ and 23 were correlated with their corresponding alcohols by saponification.

## EXPERIMENTAL

General. Merck silica gel 60 F sheets were used for analyt. TLC. HPLC was carried out on a Hibar Lichrosorb Si $60(7 \mu \mathrm{~m}$ or $10 \mu \mathrm{~m}$ ) column ( $25 \mathrm{~cm} \times 1 \mathrm{~cm}$ ).

Plant material. The plant used in this study is introduced from Japan and cultivated in suburban Taipei. A voucher specimen has been deposited in our laboratory. The leaves ( 1.4 kg ) of C.japonica D. Don. were exhaustively extracted with $\mathrm{Me}_{2} \mathrm{CO}$. The $\mathrm{Me}_{2} \mathrm{CO}$ extract was passed through a pad of charcoal, concd and re-extracted with EtOAc. The EtOAc-soluble portion ( 45 g ) was chromatographed on a silica gel column by elution with gradient of hexane and EtOAc. The appropriate frs were combined and purified by HPLC to give $16(20 \mathrm{mg}), 2$ $(16 \mathrm{mg}), 24(12 \mathrm{mg}), 25(8 \mathrm{mg}), 27(22 \mathrm{mg}), 23(27 \mathrm{mg}), 4$ $(12 \mathrm{mg}), 10(8 \mathrm{mg}), 20(13 \mathrm{mg}), 8(27 \mathrm{mg}), 15(10 \mathrm{mg}), 12$ $(11 \mathrm{mg}), 13(15 \mathrm{mg}), 26(20 \mathrm{mg}), 9(21 \mathrm{mg}), 1(15 \mathrm{mg}), 19$ $(8 \mathrm{mg}), 17(3 \mathrm{mg}), 22(12 \mathrm{mg}), 11(14 \mathrm{mg}), 14(50 \mathrm{mg}), 3$ $(3 \mathrm{mg}), 21(15 \mathrm{mg}), 18(5 \mathrm{mg}), 7(35 \mathrm{mg}), 5(5 \mathrm{mg})$ and 6 $(25 \mathrm{mg})$, in order of increasing polarity.
