# New oligo- $\alpha$-pyridylamino ligands and their metal complexes 

Ming-hwa Yang, Tzu-Wei Lin, Chin-Cheng Chou, Hsiao-Ching Lee, Hsiao-Chi Chang, Gene-Hsiang Lee, Man-kit Leung* and Shie-Ming Peng* $\dagger$<br>Department of Chemistry, National Taiwan University, Taipei, Taiwan

Three novel oligo- $\alpha$-pyridylamino ligands, tripyridyldiamine ( $\mathrm{H}_{2}$ tpda), tetrapyridyltriamine ( $\mathrm{H}_{3}$ teptra), pentapyridyltetramine ( $\mathrm{H}_{4}$ peptea) are synthesized; the crystal structures of their metal complexes with the all-anti configuration of the chelating ligands are reported.

Oligo- $\alpha$-pyridines I exhibit an $\alpha$-diimine functionality and chelating ability, they bind metal ions strongly and are used as building blocks for the self-assembly of metallosupramolecules. ${ }^{1-3}$ We are interested in developing a new type of ligand which might bind oligonuclear metal ions chain; the oligo- $\alpha$ pyridylamino ligands II. ${ }^{4-6}$

I
$n=0$, bipyridine
$n=1$, terpyridine
$n=2$, quaterpyridine
$n=3$, quinquepyridine
$n=4$, sexipyridine

$n=0$, dipyridylamine(Hdpa)
$n=1$, tripyridyldiamine $\left(\mathrm{H}_{2}\right.$ tpda)
$n=2$, tetrapyridyltriamine ( $\mathrm{H}_{3}$ teptra)
$n=3$, pentapyridyltetramine( $\mathrm{H}_{4}$ peptea)

Here, we report the synthesis of three novel oligo-$\alpha$-pyridylamino ligands, tripyridyldiamine ( $\mathrm{H}_{2}$ tpda), tetrapyridyltriamine ( $\mathrm{H}_{3}$ teptra), and pentapyridyltetramine ( $\mathrm{H}_{4}$ peptea). The crystal structure of their metal complexes with the all-anti conformation of the chelating ligands are presented.

The tripyridyldiamine ligand was synthesized by treating 2.2 equiv. of chloropyridine with 1 equiv. of 2,6 -diaminopyridine under basic conditions [eqn. (1)]. The crude product was rinsed with water and recrystallized from propan-2-ol. ${ }^{7}$ The iron complex of the ligand was synthesized by treating iron(II) chloride with 2 mol equiv. of $\mathrm{H}_{2}$ tpda in methanol [eqn. (2)]. The electronic spectrum (MeOH solution), shows maxima at 240 nm $\left(3.04 \times 10^{4} \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}\right), 262\left(3.67 \times 10^{4}\right), 278(3.81 \times$ $10^{4}$ ) and $334\left(3.72 \times 10^{4}\right)$.

The molecular structure of $\left[\mathrm{Fe}^{\mathrm{II}}\left(\mathrm{H}_{2} \text { tpda }\right)\right]^{2+}$ (Fig. 1) $\ddagger$ reveals that the coordination geometry around $\mathrm{Fe}^{\text {II }}$ is octahedral with two tridentate $\mathrm{H}_{2}$ tpda ligands arranged in a mer-configuration. The $\mathrm{H}_{2}$ tpda ligands coordinate to the iron(II) in an anti-anti-anti-anti conformation. The three pyridyl groups of the $\mathrm{H}_{2}$ tpda ligand are essentially planar and are twisted. The dihedral angle between each pair of neighboring pyridyl planes is $38^{\circ}$. The short $\mathrm{Fe}-\mathrm{N}$ distances, ranging from $1.981(2)$ to $2.005(2) \AA$, are consistent with the low spin state of $\mathrm{Fe}^{\mathrm{II}}$.
The tetrapyridyltriamine ligand was synthesized by the palladium-catalyzed cross-coupling ${ }^{8}$ of (6-bromo-2-pyri-

Fig. 1 ORTEP view of $\left[\mathrm{Fe}\left(\mathrm{H}_{2} \text { tpda }\right)_{2}\right]^{2+}$. Selected bond lengths $(\AA)$ and angles ( ${ }^{\circ}$ ): $\mathrm{Fe}-\mathrm{N} \quad 1.981(2)-2.005(2)$, av. 1.995; cis-N-Fe-N 88.68(9)-91.85(9), av. 90.0, $\mathrm{N}(1)-\mathrm{Fe}-\mathrm{N}(5) \quad 179.2(1)$, $\mathrm{N}(3)-\mathrm{Fe}-\mathrm{N}(8)$, 179.2(1), $\mathrm{N}(6)-\mathrm{Fe}-\mathrm{N}(10), 178.6(1)$; dihedral angles between interpyridyl planes, $\mathrm{Py}(\mathrm{N} 1)-\mathrm{Py}(\mathrm{N} 3), 40.8(1), \mathrm{Py}(\mathrm{N} 3)-\mathrm{Py}(\mathrm{N} 5), 34.4(1), \mathrm{Py}(\mathrm{N} 6)-\mathrm{Py}(\mathrm{N} 8)$, 40.2(1), $\mathrm{Py}(\mathrm{N} 8)-\mathrm{Py}(\mathrm{N} 10), 37.6(1)$.
dyl)(2'-pyridyl)amine and (6-amino-2-pyridyl)(2'-pyridyl)amine in the presence of catalyst $\left[\mathrm{Pd}_{2}(\mathrm{dba})_{3}\right.$, dppp, ButOK, and 18 -crown-6] in refluxing benzene [eqn. (3)]. The crude product was recrystallized from propan-2-ol. $\mathrm{H}_{3}$ teptra was characterized on the basis of ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopy, and mass spectrometry. ${ }^{1} \mathrm{H}$ NMR in $\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO}$ clearly shows two singlets ( $\delta 9.33,9.07$ ), four doublets ( $\delta 8.19,7.88,7.72$, $7.10)$ and three triplets $(\delta 7.62,7.50,6.84)$ which are consistent with the structural assignment.
The $\mathrm{Cu}^{\mathrm{II}}$ complex of the ligand was synthesized by treating an equimolar amount of $\mathrm{Cu}\left(\mathrm{ClO}_{4}\right)_{2}$ and the $\mathrm{H}_{3}$ teptra in acetonitrile [eqn. (4)]. The electronic spectrum (MeCN solution), shows maxima at $239 \mathrm{~nm}\left(2.70 \times 10^{4} \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}\right)$, $270(\mathrm{sh})\left(1.59 \times 10^{4}\right), 328\left(3.77 \times 10^{4}\right)$ and $368(9.71 \times$ $\left.10^{3}\right)$.

The molecular structure of $\left[\mathrm{Cu}^{\mathrm{II}}\left(\mathrm{H}_{3} \text { teptra }\right)\right]^{2+}$ (Fig. 2) $\ddagger$ reveals that the coordination geometry around $\mathrm{Cu}^{\mathrm{II}}$ is between planar and tetrahedral with the monohelical $\mathrm{H}_{3}$ teptra ligand having an all-anti comformation. The four pyridyl groups of the $\mathrm{H}_{3}$ teptra ligand are planar and the dihedral angle between each

Fig. 2 ORTEP view of $\left[\mathrm{Cu}\left(\mathrm{H}_{3} \text { teptra }\right)\right]^{2+}$. Selected bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right): \mathrm{Cu}-\mathrm{N}$ 1.954(5)-1.982(5), av. 1.967; $\mathrm{N}(1)-\mathrm{Cu}-\mathrm{N}(3)$, 91.9 (2), $\mathrm{N}(1)-\mathrm{Cu}-\mathrm{N}(5), 151.0(2), \mathrm{N}(1)-\mathrm{Cu}-\mathrm{N}(7) 90.9(2), \mathrm{N}(3)-\mathrm{Cu}-\mathrm{N}(5), 98.2(2)$ $\mathrm{N}(3)-\mathrm{Cu}-\mathrm{N}(7), 150.0(2), \mathrm{N}(5)-\mathrm{Cu}-\mathrm{N}(7), 93.0(2)$; dihedral angles between interpyridyl planes, $\mathrm{Py}(\mathrm{N} 1)-\mathrm{Py}(\mathrm{N} 3)$, 25.3(3), $\mathrm{Py}(\mathrm{N} 3)-\mathrm{Py}(\mathrm{N} 5), 15.0(1)$, Py(N5)-Py(N7), 20.4(2).
pair of neighboring pyridyl planes is 25.3(3), 15.0(3), 20.4(3) ${ }^{\circ}$, respectively. The short $\mathrm{Cu}-\mathrm{N}$ distances, ranging from 1.954(5) to $1.982(5)$ indicate a strong binding of the chelating ligand.

The synthesis of pentapyridyltetramine was similar to $\mathrm{H}_{3}$ teptra [eqn. (5)]. $\mathrm{H}_{4}$ peptea was characterized on the basis of its ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR and mass spectrometry data. Although the ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathrm{H}_{4}$ peptea [in $\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO}$ ] only shows two singlets ( $\delta 9.33,9.06$ ), five doublets ( $\delta 8.19,7.90,7.28,7.19$, 7.08 ) and three triplets ( $\delta 7.62,7.50,6.84$ ), the intergrated area of the triplet at $\delta 7.50$ is equivalent to that originating from three protons when compared to the area of the other triplet, indicating the existence of two independent triplets with an identical chemical shift at $\delta 7.50$.

The $\mathrm{Cu}^{\mathrm{II}}$ complex of the ligand was synthesized by treating an equimolar solution of $\mathrm{Cu}\left(\mathrm{ClO}_{4}\right)_{2}$ and $\mathrm{H}_{4}$ peptea in acetonitrile and precipitated by adding diethyl ether [eqn. (6)]. The electronic spectrum (MeCN solution), shows maxima at 254 nm $\left(1.87 \times 10^{4} \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}\right), 324\left(1.97 \times 10^{4}\right), 344(1.65 \times$ $10^{4}$ ) and $378(\mathrm{sh})\left(6.21 \times 10^{3}\right)$.

$\mathrm{H}_{4}$ peptea $+\mathrm{Cu}\left(\mathrm{ClO}_{4}\right)_{2} \xrightarrow{\mathrm{MeCN}}\left[\mathrm{Cu}^{\prime \prime}\left(\mathrm{H}_{4}\right.\right.$ peptea $\left.)\right]\left[\mathrm{ClO}_{4}\right]_{2}$

The crystal structure of $\left[\mathrm{Cu}^{\mathrm{II}}\left(\mathrm{H}_{4} \text { peptea) }\right]^{2+}\right.$ (Fig. 3) $\ddagger$ reveals that the coordination geometry around $\mathrm{Cu}^{\mathrm{II}}$ is trigonal bipyramidal with the monohelical $\mathrm{H}_{4}$ peptea ligand existing in an allanti configuration. A crystallographic $C_{2}$ axis runs through the $\mathrm{C}(13)-\mathrm{N}(5)-\mathrm{Cu}$ chain. The three independent crystallographic pyridyl groups are planar and the dihedral angle between neighboring pyridine planes is $c a .21^{\circ}$.
In summary, the modified Buchwald's procedure ${ }^{8}$ leads to the synthesis of new types of oligo- $\alpha$-pyridylamino ligands. Their metal complexes were studied. The complexes demonstrate the chelating ability of the ligands. Attempts to isolate the metal complexes with different coordination modes of the ligands, e.g. the all-syn configuration of the ligands which bind metal ions in a chain are being undertaken.
